

## Product Installation Instructions

### Advanced Power Strip

#### To complete installation you will need:

- Advanced power strip (located in your kit)
- Devices that you would like to control (TV or computer system)

#### Instructions

1. Plug electronics that require constant power into the outlets on the advanced power strip labeled “always on” (e.g., router/modem or DVR/TiVo).
2. Plug the main component (either TV or computer) into the “control” outlet.
3. Plug peripheral electronics into the “switched” outlets on the advanced power strip labeled “switched” (e.g., printer, gaming systems, scanner, speakers, receiver, amp, DVD player).
4. Adjust the threshold switch to “low” or “med” for computers and “med” or “high” for TV components.
5. Plug the advanced power strip into a grounded wall receptacle.

**CAUTION:** *When using a power strip, ensure all the connected devices will not draw more amperage than the wall outlet or power strip is designed for. Verify this by knowing the rating of the wall outlet or power strip, then by adding up the amperage of the devices plugged in.*
